

Oscillicious Releases Rocket Broadcaster

Free internet radio broadcasting software enables capturing call-in shows from Skype

Toronto, November 1, 2016 - Oscillicious Audio Labs have announced the immediate availability of Rocket Broadcaster, a new live broadcasting software app for internet radio. A free shareware edition is available, capable of streaming live to major platforms such as Radionomy, Airtime Pro, Icecast, and SHOUTcast.

Rocket Broadcaster streams live audio captured from any desktop Windows application to Icecast and SHOUTcast compatible servers. Perfect for hosting live call-in shows on Skype, Rocket Broadcaster seamlessly mixes microphone or line-in audio with desktop application audio, to help internet radio broadcasters engage their audiences with audio from new sources.

The software includes support for 5 major codecs, and is optimized for stability over long-running broadcasts. When streaming audio from other applications, track metadata can be automatically captured and passed on to listeners.

Rocket Broadcaster Pro unlocks multiple encoders and streams, so broadcasters can distribute to multiple services or target devices at once. The Pro Edition also features encrypted SSL streaming and lossless Ogg FLAC streaming, for audiophile quality streams.

Pricing and Availability

Rocket Broadcaster for Windows is available for free download from:
